                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      US-09-422-978-5006
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                US-09-422-978-5006
                                                                                                                                                          Sequence 5765, Application US/09198452A
Patent No. 6559294
GENERRAL INFORMATION:
APPLICANT: Griffais, R.
TITLE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragment;
TITLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, previous of INVENTION: and treatment of infection
FILE REFERENCE: 9710-003-99
CURRENT APPLICATION NUMBER: US/09/198,452A
CUGRENT FILING DATE: 1998-11-24
NUMBER OF SEQ ID NOS: 6849
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of II-5 receptor a. The antisense compound is useful for modulating II-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of mammalian II-5 receptor a in cells or tissues, for altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues, treating a mammalian laving a disease or condition associated with II-5 signal transduction,

expression or IL-5

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                  CC The invention relates to an antisense compound of 8-30 nucleobases in CC length, which modulates interleukin (IL)-5 signal transduction. Also CC include are a pharmaceutical composition comprising the antisense CC oligonucleotide and a pharmaceutically acceptable carrier or diluent, and CC a diagnostic kit for detecting the expression level of the membrane form CC versus soluble form of IL-5 receptor a. The antisense compound is useful CC for modulating IL-5 signal transduction, modulating expression of CC mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian CC IL-5 receptor a in mammalian cells or tissues, treating a mammalian CC in-5 expression or IL-5 receptor a in mammalian cells or tissues, treating a mammalian CC condition include eosinophilic syndrome or asthma. An antisense compound CC which alters splicing of an RNA encoding IL-5 receptor a is also useful CC for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ABX04361/c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 119
                                                                                  The invention relates to an antisense compound of 8-30 nucleobases in Clength, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense colligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form conditions of the signal transduction, modulating capression of the seful for modulating II-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of mammalian II-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian CL in receptor a in mammalian cells or tissues, treating a mammalian CC in a disease or condition associated with II-5 signal transduction, CC II-5 expression or II-5 receptor a expression, where the disease or compound cC which alters splicing of an RNA encoding II-5 receptor a is also useful CC is an antisense oligonucleotide targetting human IIS

                                                                                                                                                                                                                                     The invention relates to an antisense compound of 8-30 nucleobases in CC length, which modulates interleukin (II)-5 signal transduction. Also CC include are a pharmaceutical composition comprising the antisense CC oligonucleotide and a pharmaceutically acceptable carrier or diluent, and CC versus soluble form of II-5 receptor a. The antisense compound is useful CC versus soluble form of II-5 receptor a. The antisense compound is useful CC for modulating II-5 signal transduction, modulating expression of CC mammalian II-5 or modulating the expression of mammalian II-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian CC in-5 receptor a in mammalian cells or tissues, for altering the ratio of the isoforms of mammalian CC II-5 receptor a in mammalian cells or tissues, treating a mammalian CC condition include eosinophilic syndrome or asthma. An antisense compound CC which alters splicing of an RNA encoding II-5 receptor a is also useful CC for treating a mammal having a disease or condition. The present sequence is an antisense coligonucleotide targetting human II5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 120
                                                                   Matches

                                                                                                                                                                                                                               The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of II-5 receptor a. The antisense compound is useful for modulating II-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of the isoforms of mammalian II-5 or modulating the expression of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues, treating a mammalian II-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with II-5 signal transduction, II-5 expression or II-5 receptor a expression, where the disease or condition associated or asthma in antisease or compound include acceptorability acceptor as the disease or compound include acceptorability and a participates or asthma.
                                                                                                                                   Sequence 20
                                                                                                                                                                IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Dean

                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an antisense compound of 8-30 nucleobases in CC length, which modulates interleukin (II)-5 signal transduction. Also CC include are a pharmaceutical composition comprising the antisense CC oligonucleotide and a pharmaceutically acceptable carrier or diluent, and CC a diagnostic kit for detecting the expression level of the membrane form CC versus soluble form of IL-5 receptor a. The antisense compound is useful CC for modulating IL-5 signal transduction, modulating expression of CC mammalian IL-5 or modulating the expression of the isoforms of mammalian CC in cells or tissues, for altering the ratio of the isoforms of mammalian CC IL-5 receptor a in mammalian cells or tissues, treating a mammalian CC condition include eosinophilic syndrome or asthma. An antisense compound CC which alters splicing of an RNA encoding IL-5 receptor a is also useful CC for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an antisense compound of 8-30 nucleobases in CC length, which modulates interleukin (II)-5 signal transduction. Also CC include are a pharmaceutical composition comprising the antisense CC oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form CC versus soluble form of IL-5 receptor a. The antisense compound is useful CC for modulating IL-5 signal transduction, modulating expression of CC in cells or tissues, for altering the expression of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian CC in Freeptor a in mammalian cells or tissues, treating a mammalian CC IL-5 expression or IL-5 receptor a spondation associated with IL-5 signal transduction, CC iL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound CC which alters splicing of an RNA encoding IL-5 receptor a is also useful CC for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                   Matches

                                                                                                                                                                                                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an antisense compound of 8-30 nucleobases in CC length, which modulates interleukin (II)-5 signal transduction. Also CC include are a pharmaceutical composition comprising the antisense CC oligonucleotide and a pharmaceutically acceptable carrier or diluent, and CC a diagnostic kit for detecting the expression level of the membrane form CC versus soluble form of IL-5 receptor a. The antisense compound is useful CC for modulating IL-5 signal transduction, modulating expression of CC mammalian IL-5 or modulating the expression of the isoforms of mammalian CC in cells or tissues, for altering the ratio of the isoforms of mammalian CC IL-5 receptor a in mammalian cells or tissues, treating a mammalian CC condition or IL-5 receptor a signal transduction, CC in-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound CC which alters splicing of an RNA encoding IL-5 receptor a is also useful CC for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                      mammalian II-5 or modulating the expression of mammalian II-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with II-5 signal transduction, II-5 expression or II-5 receptor a expression, where the disease or condition include eosimophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding II-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human II-5
                                                                                                                                                                                                                                                   The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an antisense compound of 8-30 nucleobases in Clength, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense coligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian chaving a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

```
The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of II-5 receptor a. The antisense compound is useful for modulating II-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of mammalian II-5 receptor a for altering the expression of the isoforms of mammalian II-5 receptor a for altering the ratio of the isoforms of mammalian II-5 receptor a for altering the ratio of the isoforms of mammalian having a disease or condition associated with II-5 signal transduction, II-5 expression or II-5 receptor a expression, where the disease or
                                                        condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 20; Page 19; 77pp; English

The invention relates to an antisense compound of 8-30 nucleobases length, which modulates interleukin (II)-5 signal transduction. Al include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or dilue

nucleobases

The invention relates to an antisense compound of 8-30 nucleobases i length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent a diagnostic kit for detecting the expression level of the membrane versus soluble form of II-5 receptor a. The antisense compound is us for modulating II-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of faminalian II-5 or modulating the expression of the isoforms of mammalian II-5 or modulating the expression of the isoforms of mammalian II-5 or modulating the expression of the isoforms of mammalian II-5 or modulating the expression of the isoforms of mammalian II-5 or modulating the expression of the isoforms of mammalian II-5 or modulating the expression of the isoforms of mammalian II-5 or modulating the expression of the isoforms of mammalian II-5 or modulating the expression of the isoforms of mammalian II-5 or modulating the expression of the isoforms of mammalian II-5 or modulating the expression of mammalian II-5

An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with IL-5 signal transduction,
                                                                                                                                                                                                                                                                                                                               Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                a diagnostic kit for detecting the expression level of the membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ABX04360;

                                             The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of II-5 receptor a. The antisense compound is useful for modulating II-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of mammalian II-5 receptor a in mammalian cells or tissues, for altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues, transduction, having a disease or condition associated with II-5 signal transduction, transduction, and transduction is transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        having a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
IL-5 expression or IL-5 receptor a expression, where the disease condition include eosinophilic syndrome or asthma. An antisense which alters splicing of an RNA encoding IL-5 receptor a is also
                                                                                                                                                                                                                                                                                         Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  26-MAR-1999; 99US-00280799

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                      length, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                   (DEAN/) DEAN N M.

The invention relates to an antisense compound of 8-30 nucleobases in clength, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian in IL-5 receptor a in mammalian cells or tissues, treating a mammalian in IL-5 expression or IL-5 receptor a is syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5

CC include are a pharmaceutical composition comprising the antisense CC oligonucleotide and a pharmaceutically acceptable carrier or diluent, and CC a diagnostic kit for detecting the expression level of the membrane form CC versus soluble form of IL-5 receptor a. The antisense compound is useful CC mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, of in cells or tissues, for altering the ratio of the isoforms of mammalian CC IL-5 receptor a in mammalian cells or tissues, treating a mammalian CC having a disease or condition associated with IL-5 signal transduction, CC IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                        밁

                                                                                                                                                                                                                                                                                                                                                                                              versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 receptor a mammalian IL-5 receptor a latering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, for altering the ratio of the isoforms of mammalian latering a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, a diagnostic kit for detecting the expression level of the membrane from the membrane of the membrane for                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal
                                                                                                                                                                                                                                                                                                                                               Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     26-MAR-1999; 99US-00280799

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of II-5 receptor a. The antisense compound is useful for modulating II-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of the isoforms of mammalian II-5 receptor a for altering the ratio of the isoforms of mammalian II-5 receptor a for altering the ratio of the isoforms of mammalian III-5 receptor a mammalian cells or tissues, treating a mammalian having a disease or condition associated with II-5 signal transduction, lII-5 expression or II-5 receptor a expression, where the disease or condition associated with II-5 signal transduction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal
                                                                                                                                                                                                                                                                                                                                                                        ABX04366 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Seguence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 20; Page 19; 77pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transduction.

```
length, which modulates interleukin (II)-5 signal transduction. Also conclude are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 receptor a, in cells or tissues, for altering the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian Claving a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of the isoforms of mammalian in cells or tissues, for altering the ratio of the isoforms of mammalian in cells or tissues, for altering the ratio of the isoforms of mammalian in having a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an antisense compound of 8-30 nucleobases in clerity, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a in antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

CC The invention relates to an antisense compound of 8-30 nucleobases in CC length, which modulates interleukin (IL)-5 signal transduction. Also CC include a pharmaceutical composition comprising the antisense CC oligonucleotide and a pharmaceutically acceptable carrier or diluent, and CC a diagnostic kit for detecting the expression level of the membrane form CC versus soluble form of II-5 receptor a. The antisense compound is useful CC for modulating IL-5 signal transduction, modulating expression of CC mammalian II-5 or modulating the expression of mammalian II-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian CC in cells or tissues, for altering the ratio of the isoforms of mammalian CC in cells or tissues or condition associated with II-5 signal transduction, CC in-5 expression or II-5 receptor a expression, where the disease or CC condition include eosinophilic syndrome or asthma. An antisense compound CC which alters splicing of an RNA encoding II-5 receptor a is also useful CC is an antisense oligonucleotide targetting human IIS

Quantifying in vivo RNA from a biological sample for producing a medicament for treating immune related disease by determining in vlevels of transcripts using nucleic acid/reverse transcription-PCR of transcripts using t mix in an automated nucleic setup. Vivo

42; 83pp; English

The present invention relates to a method of quantifying in vivo RNA fix a biological sample. This involves collecting the biological sample in tube comprising a compound inhibiting RNA degradation and/or gene induction, forming a precipitate comprising nucleic acids, separating t separating the from þ

Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       precipitate from the supernatant, dissolving the precipitate using a buffer, forming a suspension, isolating nucleic acids from the suspension using an automated device, dispersing or distributing a reagent mix for reverse transcription (RT)-PCR using an automated device, dispersing or distributing the nucleic acids isolated within the dispersed reagent mix using an automated device and determining the in vivo levels of transcripts using the nucleic acid and RT-PCR reagent mix of the previous step in an automated setup. The method is useful for monitoring or detecting changes in in vivo nucleic acids levels in a biological agent present, such as eukaryotic or prokaryotic cells, viruses or phages in a biological sample or for producing a medicament for treating immune related disease, e.g., autoimmunity, rheumatoid arthitis, multiple sclerosis, cancer, immunodeficiencies such as ADDS, allergy, graft rejection or Graft versus Host Disease. The present sequence is a PCR primer/probe used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

The invention relates to a novel pharmaceutical composition, which has first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or

This invention describes a nucomprising oligonucleotides, bronchoconstriction, respira

a novel composition (a) a first active agent, des, effective for alleviating piratory tract inflammation, allergies and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cc masal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention cc has antiinflammatory, antiallergic, antiasthmatic, hypotensive, cc immunosuppressive, and cytostatic activity. The composition may have a cure in antisense gene therapy. The composition is useful for treating or greventing a respiratory, lung or malignant disease or condition, also cc for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction. Clung inflammation, lung allergies, or a respiratory disease or condition. Clung inflammation, but was obtained in electronic format directly from WIPO at fifth, wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cc reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, cc surfactant depletion or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating cc expression of a target polypeptide associated with lung airway or lung cysfunction or cancer and can be anti-sense to the corresponding mRNA. Cc device, in separate containers, (b) the oligonucleotides, (c) contributions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, contributed or comprises of the composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The culture the amount of target polypeptide present in the lungs. The culture adisease or condition such as pulmonary vasoconstriction, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, respiratory conditions, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. Cc thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system ce., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

CC II-5 or II-5 receptor a, where the antisense compound modulates the CC expression of mammalian II-5 or II-5 receptor a. The antisense coligonucleotide comprises at least one modified internucleoside linkage, ci.e. a phosphorothioate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-O-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or CC tissues comprises contacting the cells or tissues with an antisense CC compound so that the ratio of the mammalian II-5 receptor a isoforms is CC altered. Treating a mammal having a disease or condition associated with CI-5 signal transduction or II-5 or II-5 receptor a expression, or a CC disease or condition characterised by a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an antisense compound so that II-5 signal transduction, II-5 or II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           IL-5) signal transduction. The antisense compound that modulates interleukin oligonucleotide targeted to a nucleic acid molecule encoding a mammalian IL-5 or IL-5 receptor a, where the antisense

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           i.e. a phosphorothicate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'.O-methoxyethyl sugar moiety, and at least one modified nucleobase, i.e. 5-methylycytosine. Altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues comprises contacting the cells or tissues with an antisense compound so that the ratio of the mammalian II-5 receptor a isoforms is altered. Treating a mammal having a disease or condition associated with II-5 signal transduction or II-5 or II-5 receptor a expression, or a disease or condition characterised by a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an antisense compound so that II-5 signal transduction, II-5 or II-5 receptor a expression, or II-5 receptor a is modulated, the ratio of II-5 receptor a isoforms is altered, or expression of membrane II-5 receptor a series of II-5 receptor a serie
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      IL-5 or IL-5 receptor a, where the antisense compound modulates the expression of mammalian IL-5 or IL-5 receptor a. The antisense oligonucleotide comprises at least one modified internucleoside linkage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -5 (II-5) signal transduction. The antisense compound is an a cligonucleotide targeted to a nucleic acid molecule encoding II-5 or II-5 receptor a. where the anticon-
                                                                                                                                                                                                                                                                                                                                                                                                                                                          IL-5 receptor a; phosphorothicate; 2'-O-methoxyethyl s 5-methylcytosine; IL-5 signal transduction; apoptosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human interleukin-5 (IL-5) DNA antisense oligonucleotide #3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             modulated. The antisense compounds, methods and compositions are eful in promoting apoptosis and in treating eosinophilic syndrome and thma. This sequence represents a human IL-5 DNA antisense igonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2352 CATACTGACACTTTGCCAGA 2371

```
CC IL-5 or IL-5 receptor a, where the antisense compound modulates the CC expression of mammalian IL-5 or IL-5 receptor a. The antisense coligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothicate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-O-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or cissues comprises contacting the cells or tissues with an antisense CC compound so that the ratio of the mammalian IL-5 receptor a isoforms is CC matered. Treating a mammal having a disease or condition associated with CC IL-5 signal transduction or IL-5 or IL-5 receptor a expression, or a CC disease or condition characterised by a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an antisense compound so that IL-5 signal transduction. IL-5 or IL-5 receptor a isoforms is altered, or expression of membrane IL-5 receptor a isoforms is altered, or expression of membrane IL-5 receptor a is modulated. The antisense compounds, methods and compositions are coligonal solide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                     oligonucleotide targeted to a nucleic acid molecule encoding IL-5 or IL-5 receptor a, where the antisense compound modula

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
The invention relates to an antisense compound that modulates interleukin CC -5 (IL-5) signal transduction. The antisense compound is an antisense CC oligonuclectide targeted to a nucleic acid molecule encoding a mammalian CC IL-5 or IL-5 receptor a, where the antisense compound modulates the CC expression of mammalian IL-5 or IL-5 receptor a. The antisense CC i.e. a phosphorothicate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-0-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methoxyethyl sugar moiety, and at CC its sues comprises contacting the cells or tissues with an antisense CC compound so that the ratio of the mammalian IL-5 receptor a in mammalian cells or CC compound so that the ratio of the mammalian IL-5 receptor a isoforms is CC altered. Treating a mammal having a disease or condition associated with CC IL-5 signal transduction or IL-5 or IL-5 receptor a expression, or a CC disease or condition characterised by a reduction in apoptosis comprises antisense compound so that IL-5 signal transduction, IL-5 or IL-5 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         receptor a expression, or IL-5 receptor a is modulated, the ratio of IL-5 receptor a isoforms is altered, or expression of membrane IL-5 receptor a is modulated. The antisense compounds, methods and compositions are useful in promoting apoptosis and in treating eosinophilic syndrome and asthma. This sequence represents a human IL-5 DNA antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Dean

CC II-5 or II-5 receptor a, where the antisense compound modulates the CC expression of mammalian II-5 or II-5 receptor a. The antisense CC oligonucleotide comprises at least one modified internucleoside linkage, CC i.e. a phosphorothicate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-0-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio CC of the isoforms of mammalian II-5 receptor a in mammalian cells or CC tissues comprises contacting the cells or tissues with an antisense CC compound so that the ratio of the mammalian II-5 receptor a isoforms is CC altered. Treating a mammal having a disease or condition associated with CC II-5 signal transduction or II-5 or II-5 receptor a expression, or a CC disease or condition characterised by a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an CC antisense compounds that II-5 signal transduction, II-5 or II-5 CC receptor a expression, or II-5 receptor a is modulated, the ratio of II-5 modulated. The antisense compounds, methods and compositions are CC useful in promoting apoptosis and in treating eosinophilic syndrome and CC asthma. This sequence represents a human II-5 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     26-MAR-1999;

                                                                                                                                                                                                                                                 5
                                                                                                                                                                                                                                                                                                                                                                     CC -5 (II-5) signal transduction. The antisense compound is an antisense CC oligonucleotide targeted to a nucleic acid molecule encoding a mammalian CC II-5 or II-5 receptor a, where the antisense compound modulates the CC expression of mammalian II-5 or II-5 receptor a. The antisense compound modulates the CC oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothioate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-0-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues with an antisense CC compound so that the ratio of the mammalian II-5 receptor a isoforms is altered. Treating a mammal having a disease or condition associated with CII-5 signal transduction or II-5 or II-5 receptor a expression, or a CC disease or condition characterised by a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an antisease compound so that II-5 signal transduction, II-5 or II-5 or II-5 or II-5 receptor a expression of internation of membrane II-5 receptor a is modulated. The antisense compounds, methods and compositions are CC is modulated. The antisense compounds, methods and compositions are CC oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                 Best Loca

The invention relates to an antisense compound that modulates interleukin c5 (II-5) signal transduction. The antisense compound is an antisense coligonucleotide targeted to a nucleic acid molecule encoding a mammalian CC II-5 or II-5 receptor a, where the antisense compound modulates the CC expression of mammalian II-5 or II-5 receptor a. The antisense compound modulates the CC oligonucleotide comprises at least one modified internucleoside linkage, c1.e. a phosphorothioate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-0-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues comprises contacting the cells or tissues with an antisense CC compound so that the ratio of the mammalian II-5 receptor a insoforms is altered. Treating a mammal having a disease or condition sesociated with CI is signal transduction or II-5 or II-5 receptor a expression, or a catisense compound so that II-5 signal transduction, II-5 or II-5 o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (DEAN/) DEAN N M.

                                                                                                                                                                                      The invention relates to an antisense compound that modulates interleukin CC -5 (II-5) signal transduction. The antisense compound is an antisense CC oligonucleotide targeted to a nuclecic acid molecule encoding a mammalian CC II-5 or II-5 receptor a, where the antisense compound modulates the CC expression of mammalian II-5 or II-5 receptor a. The antisense compound modulates the CC oligonucleotide comprises at least one modified internucleoside linkage, CC i.e. a phosphorothioate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-0-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio CC of the isoforms of mammalian II-5 receptor a in mammalian cells or CC tissues comprises contacting the cells or tissues with an antisense CC altered. Treating a mammal having a disease or condition associated with CI-5 signal transduction or II-5 or II-5 receptor a expression, or a CC disease or condition characterised by a reduction in apoptosis comprises CC antisense compound so that II-5 signal transduction, II-5 or II-5 creceptor a expression of an antisense compound so that II-5 receptor a transduction of II-5 creceptor a spread of II-5 or II-5 receptor a spread of II-5 or II-5 creceptor a spread of II-5 or II-5 receptor a spread of II-5 receptor a

i.e. a phosphorothioate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-O-methoxyethyl sugar moiety, and at least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues comprises contacting the cells or tissues with an antisense compound so that the ratio of the mammalian IL-5 receptor a isoforms is altered. Treating a mammal having a disease or condition associated with IL-5 signal transduction or IL-5 or IL-5 receptor a expression, or a disease or condition characterised by a reduction in apoptosis comprises administering to the mammal at therapeutic or prophylactic amount of an antisense compound so that IL-5 signal transduction, IL-5 or IL-5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  IL-5 or IL-5 receptor a, where the antisense compound modulates the expression of mammalian IL-5 or IL-5 receptor a. The antisense oligonucleotide comprises at least one modified internucleoside linkage,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Dean
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; interleukin-5; IL-5; ss; antisense oligonucleotide; IL-5 receptor a; phosphorothioate; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; IL-5 signal transduction; apoptosis; eosinophilic syndrome; asthma; antiasthmatic; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -5 (IL-5) signal transduction. The antisense compound is an eligonucleotide targeted to a nucleic acid molecule encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an antisense compound that modulates interleukin -5 (II-5) signal transduction. The antisense compound is an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense compound modulating useful in promoting apoptosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (KARR/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         07-MAR-2001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        06-OCT-2003; 2003US-00679532.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          US2004121376-A1

                                                                                                                                                                                                 CC oligonuclectide targeted to a nucleic acid molecule encoding a mammalian CC IL-5 or IL-5 receptor a, where the antisense compound modulates the CC expression of mammalian IL-5 or IL-5 receptor a. The antisense CC oligonuclectide comprises at least one modified internucleoside linkage, CC i.e. a phosphorothicate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-0-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues with an antisense CC compound so that the ratio of the mammalian IL-5 receptor a in seforms is altered. Treating a mammal having a disease or condition associated with CC IL-5 signal transduction or IL-5 or IL-5 receptor a expression, or a condition characterised by a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an CC antisense compound so that IL-5 receptor a is modulated, the ratio of IL-5 receptor a isoforms is altered, or expression of membrane IL-5 receptor a isoforms is altered or prophylactic account of an infigence of the prophylactic amount of an infigence of the prophylactic amount of an infigence of the prophylactic amount of an infigence of the prophylactic account of the mammal and the prophylactic amount of an infigence of the prophylactic and the prophylactic amount of an infigence of the prophylactic amount of an infigence of the prophylactic account of the prophylactic amount of an infigence of the prophylactic amount of the prophylactic amou

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δ
                                                                                                                                                                               CC expression of mammalian IL-5 or IL-5 receptor a, where the antisense compound modulates the compression of mammalian IL-5 or IL-5 receptor. The antisense coligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothicate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-0-methoxyethyl sugar moiety, and at least one modified sugar moiety, i.e. a 2'-0-methoxyethyl sugar moiety, and at least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues comprises contacting the cells or tissues with an antisense compound so that the ratio of the mammalian IL-5 receptor a isoforms is compound so that IL-5 or IL-5 receptor a expression, or a disease or condition characterised by a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an creeptor a expression, or the sufficient or IL-5 signal transduction, IL-5 or IL-5 compound so that IL-5 signal transduction, IL-5 or IL-5 compound so that IL-5 signal transduction, IL-5 or IL-5 compound so that IL-5 signal transduction, IL-5 or IL-5 compound so that IL-5 signal transduction, IL-5 or IL-5 compound so that IL-5 signal transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (DEAN/) DEAN N M.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
i.e. a phosphorothioate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-O-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio CC of the isoforms of mammalian IL-5 receptor a in mammalian cells or CC tissues comporises contacting the cells or tissues with an antisense compound so that the ratio of the mammalian IL-5 receptor a isoforms is CC altered. Treating a mammal having a disease or condition associated with CC disease or condition or IL-5 or IL-5 receptor a expression, or a CC disease or condition characterised a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an CC receptor a expression, or IL-5 signal transduction, IL-5 or IL-5 creeptor a isoforms is altered, or expression of membrane IL-5 receptor a isoforms is altered, or expression of membrane IL-5 receptor a is modulated. The antisense compounds, methods and compositions are useful in promoting apoptosis and in treating eosinophilic syndrome and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         26-MAR-1999;
17-MAR-2000;
07-MAR-2001;
                                                                                                                                                                                                                                                                                                                                                                              -5 (IL-5) signal transduction. The antisense compound that modulates oligonucleotide targeted to a nucleic acid molecule encoding a IL-5 or IL-5 receptor a, where the antisense compound
                                                                                                                                                                                                                                                                                                                                       IL-5 or IL-5 receptor a, where the antisense compound modulates the expression of mammalian IL-5 or IL-5 receptor a. The antisense oligonucleotide comprises at least one modified internucleoside linkage,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; interleukin-5; IL-5; 88; antisense oligonucleotide; IL-5 receptor a; phosphorothioate; 2'.O-methoxyethyl sugar moiety; 5-methylcytosine; IL-5 signal transduction; apoptosis; eosinophilic syndrome; asthma; antiasthmatic; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antiBense compound modulating useful in promoting apoptosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (DEAN/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ś
CC -5 (II-5) signal transduction. The antisense compound is an antisense coligonucleotide targeted to a nucleic acid molecule encoding a mammalian CC II-5 or II-5 receptor a, where the antisense compound modulates the CC expression of mammalian II-5 or II-5 receptor a. The antisense compound could be antisense of i.e. a phosphorothioate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-O-methoxyethyl sugar moiety, and at CC iesat one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or CC issues comprises contacting the cells or tissues with an antisense cC compound so that the ratio of the mammalian II-5 receptor a isoforms is CC il-5 signal transduction or II-5 or II-5 receptor a expression, or a CC issues or condition characterised by a reduction in apoptousis comprises comprises compound so that the ratio of the mammalian II-5 receptor a expression, or a CC altered. Treating a mammal having a disease or condition associated with CC II-5 signal transduction or II-5 or II-5 receptor a expression, or a CC antisense compound so that II-5 signal transduction, II-5 or II-5 o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The invention relates to an antisense compound that modulates interleukin -5 (IL-5) signal transduction. The antisense compound is an antisense oligonucleotide targeted to a nucleic acid molecule encoding a mammalian IL-5 or IL-5 receptor a, where the antisense compound modulates the expression of mammalian IL-5 or IL-5 receptor a. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothicate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-O-methoxyethyl sugar moiety, and at least one modified sugar moiety, i.e. a 2'-O-methoxyethyl sugar moiety, and at least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues comprises contacting the cells or tissues with an antisense compound so that the ratio of the mammalian IL-5 receptor a isoforms is altered. Treating a mammal having a disease or condition associated with
                                                                                                                                                                                                                                                                                                                                                                                                    26-MAR-1999;

```

The invention relates to an antisense compound that modulates interleukin -5 (IL-5) signal transduction. The antisense compound is an antisense oligonucleotide targeted to a nucleic acid molecule encoding a mammalian IL-5 or IL-5 receptor a, where the antisense compound modulates the expression of mammalian IL-5 or IL-5 receptor a. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothioate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-O-methoxyethyl sugar moiety, and at least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio

New antisense compound useful in promoting

und modulating apoptosis and

interleukin-5 signal transduction, in treating eosinophilic syndrome

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  IL-5 signal transduction or IL-5 or IL-5 receptor a expression, or a disease or condition characterised by a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an antisense compound so that IL-5 signal transduction, IL-5 or IL-5 receptor a expression, or IL-5 receptor a is modulated, the ratio of IL-5 receptor a isoforms is altered, or expression of membrane IL-5 receptor a is modulated. The antisense compounds, methods and compositions are useful in promoting apoptosis and in treating easinophilic syndrome and asthma. This sequence represents a human IL-5 DNA antisense oligonucleotide of the invention.

Treating a mammal having a disease or condition associated with IL-5 signal transduction or IL-5 or IL-5 receptor a expression, or a disease or condition characterised by a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an antisease compound so that IL-5 signal transduction, IL-5 or IL-5 receptor a expression, or IL-5 receptor a is modulated, the ratio of IL-5 receptor a isoforms is altered, or expression of membrane IL-5 receptor a isoforms is altered, or expression of membrane IL-5 receptor a sound of the control of IL-5 receptor a isoforms is altered, or expression of membrane IL-5 receptor a isoforms is altered, or expression of membrane IL-5 receptor a isoforms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       is modulated. The antisense compounds, methods and compositions are useful in promoting apoptosis and in treating eosinophilic syndrome asthma. This sequence represents a human IL-5 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; interleukin-5; IL-5; 88; antisense oligonucleotide; IL-5 receptor a; phosphorothioate; 2'.O-methoxyethyl sugar moiety; 5-methylcytosine; IL-5 signal transduction; apoptosis; eosinophilic syndrome; asthma; antiasthmatic; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
```

The invention relates to an antisense compound that modulates interleukin -5 (IL-5) signal transduction. The antisense compound is an antisense oligonucleotide targeted to a nucleic acid molecule encoding a mammalian IL-5 or IL-5 receptor a, where the antisense compound modulates the

of mammalian IL-5 or IL-5

The invention relates to an antisense compound that modulates interleukin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cc. i.e. a phosphorothicate linkage, or a peptide nucleic acid, at least one commodified sugar moiety, i.e. a 2'-O-methoxyethyl sugar moiety, and at cc. least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues comprises contacting the cells or tissues with an antisense compound so that the ratio of the mammalian IL-5 receptor a isoforms is caltered. Treating a mammal having a disease or condition associated with CL-5 signal transduction or IL-5 or IL-5 receptor a expression, or a clisease or condition characterised by a reduction in apoptosis comprises cadministering to the mammal a therapeutic or prophylactic amount of an antisease compound so that IL-5 signal transduction, IL-5 or                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     coligonucleocide targeted to a nucleic acid molecule encoding a mammalian III-5 or II-5 receptor a, where the antisense compound modulates the expression of mammalian III-5 or II-5 receptor a. The antisense compound modulates the expression of mammalian II-5 or II-5 receptor a. The antisense oligonucleocide comprises at least one modified internucleoside linkage, i.e. a phosphorothioate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-0-methoxyethyl sugar moiety, and at least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues comprises contacting the cells or tissues with an antisense compound so that the ratio of the mammalian II-5 receptor a isoforms is altered. Treating a mammal having a disease or condition associated with II-5 signal transduction, or a disease or condition characterised by a reduction in apoptosis comprises antisense compound so that II-5 signal transduction. II-5 or II-5 acceptor a expression, or a notisense compound so that II-5 signal transduction, II-5 or II-5 is modulated, the ratio of II-5 receptor a isoforms is altered, or expression of membrane II-5 receptor a spression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         is modulated. The antisense compounds, methods and compositions are seful in promoting apoptosis and in treating eosinophilic syndrome and asthma. This sequence represents a human IL-5 DNA antisense oligonucleotide of the invention.
